Capsugel® is the world's leading supplier of two-piece capsules. With over 140 years of production experience, Capsugel offers formulation services, patented dosage delivery technology, and liquid and precision powder filling equipment. Companies look to our leadership to help them formulate new products, enhance existing product lines, bring new products to market faster, and ensure their clinical trials are conducted without bias.

Broad Range of Products & Services

With a diverse product line, including hard gelatin, softgel, non-animal, and fish gelatin capsules, we are at the forefront of bringing to market the highest quality polymers, each designed and tailored for specific applications. Combined with our innovative R&D machines, like the CFS 1200 liquid filling and sealing machine and our Xcelodose® S Precision Powder Micro-dosing System, customers count on Capsugel support from formulation to final production.

Capsugel supports clinical development with the CFS 1200 capsule liquid filling and sealing bench top machine

for R&D Labs as well as 100- and 300-hole benchtop fillers. The Xcelodose® S system creates clinical trial batches in precisely dispensed amounts as low as 100 micrograms. With Xcelodose, capsules can be filled with drug substances alone, eliminating the need for excipient compatibility and preformulation activities.

Committed to Quality & Education

To ensure our customers receive the very best quality products and services, we employ the principles of Six-Sigma throughout our entire organization. In addition, we have also implemented numerous process quality initiatives to help reduce defects rates and improve the overall quality of our products. And our vast technical reference library, containing independent studies and articles, as well as articles written by our own scientists, is viewed as an invaluable resource by our customers. As an active industry supporter, Capsugel also gives presentations about dosage forms to pharmaceutical students at universities.
